                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      incorporated into a plasmid used for the recombinant production of GRB proteins. Using a new cloning technique, CORT (cloning of receptor trargets) several new TK binding proteins were isolated, Growth Factor receptor bound proteins GRB-1, GRB-3, GRB-4, GRB-7 and GRB-10 were isolated using this method. The proteins bind to a tyrosine-phosphorylated domain of a eukaryotic TK. GRB proteins can be used for screening agents which are capable of modulating cell growth that occurs via signal transduction through TKs. Such agents can be used to prevent or inhibit cell growth or to counteract tumour development. GRB proteins are also useful for identifying susceptibility to diseases asociated with alterations in cellular metabolism mediated by TK pathways e.g. cancer and diabetes.
vector for producing heterologous polypeptides in a halobacterial host.

```

```
A recombinant vector in which a DNA sequence encoding at least the generic lactoferrisin antibacterial peptide AAR88216 is inserted, pref. downstream of the vector's regulatory sequence, is claimed. The protease fragment AAR88219 and the DNA sequences AAT08774-79 were used in the construction of such a vector, where the regulatory sequence is the tac promoter from shuttle vector pGEX2, the GAL1 promoter from vector pKOM2 or Rous Sarcoma Virus long terminal

Cleavage of the fusion protein with Factor-Xa yields alpha-lactalbumin, which is removed by an affinity method, and purified calcitonin of therapeutic appln. Alternatively, the linker comprises the activation peptide (AAR83118) of trypsinogen, which includes the recognition sequence (AAR83117) for enterokinase.

Patent No. 5635371

GENERAL INFORMATION:
APPLICANT: Stout, Jay
APPLICANT: Coolidge, Thomas R.
APPLICANT: Holmquist, Barton
TITLE OF INVENTION: CHEMICAL METHOD FOR SELECTIVE
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: POLYPEPTIDE OR A PORTION THEREOF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         APPLICANT: Kjeldsen, Thomas B

Sequence 6, Application US/10066209

Patent No. US20020115110A1

GENERAL INFORMATION:

APPLICANT: Brigham-Burke, Michael R.

APPLICANT: Brigham-Burke, Michael R.

APPLICANT: Brigham-Burke, Michael R.

APPLICANT: Woung, Peter R.

TITLE OF INVENTION: A METHOD OF IDENTIFYING ACONIST AND

FILE REFERENCE: GH-50030-D1

CURRENT APPLICATION NUMBER: US/10/066,209

FRIOR APPLICATION NUMBER: 09/072,993

PRIOR FILING DATE: 1998-05-06

PRIOR APPLICATION NUMBER: 60/055,513

PRIOR PLING DATE: 1997-08-13

PRIOR FILING DATE: 1997-08-26

PRIOR APPLICATION NUMBER: 60/055,550

PRIOR APPLICATION NUMBER: 60/055,550

PRIOR PILING DATE: 1997-08-29

**NUMBER OF SEQ ID NOS: 9

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived nucleic acid probes for measuring gene expression in a sample derived crow man breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label control from mRNA of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition analysis is useful for assessing the toxicity of chanical expression analysis is useful for assessing the toxicity of chanical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence thay microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GGTAAATATTTCACTCCTTCCAAAAGACGCCCAGTTGAGTCTCAATACCTTGGATTTGCA 2120

                                                                                               The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
Single exon nucleic acid probes for analyzing gene expression in human

(SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                            Probe #2910 for gene expression analysis in human cervical cell sample.

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1701 AGGIGCCIAIAGIGACAAICCAAIAAIICGACAIGCIICIAIIGCCAACAAGIGGAAAAC 1760

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for a nucleic acid expressed in the human staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases of the breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast diseases and non-carcinoma tumnours.
                                                                         Probe; human; breast disease; breast cancer; development disorder; ss; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel single exon nucleic acid probe used to measuring gene expression in a human breast -

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid store acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probess, Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a probes; the novel set of probes which hybridise at high stringency to a nucleic acid expression in a confirming second from dend from human lung; comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably confirming a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon tissues and/or cell types using hybridisation to a single exon tissues and the exons should be assigned to a single exon, where a common pattern of expression nof the exons in the tissues and/or cell types indicates that the exons should be assigned to a single exon, or encoded by the expression nof the exons in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly cusing human lung derived microarray chronic obstructive purposes are used for gene probes when the chronic obstructive mentioned in t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermannsky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangioleiomyontosis, pulmonary pulmonary alvociar professions (Karagener Syndrome, fibrocystic pulmonary dysplasia, primary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Spatially-addressable set of single exon nucleic acid probes, used to
Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangiolelomyontosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    measure gene expression in human lung samples -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID No 2911; 634pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chen W, Rank DR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (MOLE-) MOLECULAR DYNAMICS INC.

agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled uncleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1701 AGGIGCCTATAGTGACAATCCAATAATTCGACATGCTTCTATTGCCAACAAGTGGAAAAC 1760

The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pct_sequences.
                          Probe #12148 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1641 TCCAAAAGGTGAATGCCTGCCTTATTTCAGCTTTGCAGAAGTAGCCAAAAAGAGGAGTTGA 1700

The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                           1701 AGGIGCCIATAGIGACAAICCAAIAATICGACAIGCTICIAIIGCCAACAAGIGGAAAAC 1760

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast tibrocystic changes, proliferative breast diseases of the human breast, and the breast, inflammatory diseases of the breast, inflammatory diseases of the breast, include.
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

complements or the 12387 open reading trames derived from the Lord, probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a probes; the novel set of probes which hybridise at high stringency to ample derived from human lung; measuring gene expression in a collection of detectably labeled nucleic acids derived from human lung a collection of detectably labeled nucleic acids derived from human lung and the array; identifying exons in a cukaryotic genome, comprising the label detectably bound to each probe of the euraryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung minh, to a single exon probe, labeled nucleic acids from eukaryote lung minh, to a single exon probe, having a fragment identifying exons from genomic sequences of the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon in the above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the expression reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprossopen reading frames (ORF). The probes are used for gene cyprosis, and for identifying exons in a gene, particularly expression analysis, and for identifying exons in a gene, particularly companies, neurofibromatosis, tuberous sclerosis, gaucher's glanders, purpoma ; 0 The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 hypertension 1701 AGGIGCCIATAGIGACAATCCAATAATICGACAIGCIICTAIIGCCAACAAGIGGAAAAC 1760 1761 CATCCACCTCATAATGCACAGTGGAATGAATGCCACCACAATACATTTAAATCTCACGTT 1820 1581 AGATCATTITCATGAATTGTATAAAGTGATCCTTCTCCCAAACCAGACTCACTATATTAT 1640 998 Gaps pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary alveolar proteinosis, Raragener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertens and hyaline membrane disease. The present sequence is a single exon probe open reading frame of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, DB 24; Length 1125; ; 0 Pred. This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, remotactic/chemokinetic activity, the EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2894 AAGAATITGACAAGACGICATITICACAAAGIGCGCCATICIGAGGAIAIGCAGIITGCCI 2953

AAA43426 to AAA45925 represent specifically claimed secreted expressed sequence tags (SESTs), isolated from human, mouse, chicken and rat tissue sources. The SESTs can have a range of activities depending on the tissue sources. The SESTs can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic; commonstatic; antibacterial; antilungal; antiviral; antidiabetic; antibacterial; antilucer; osteopathic; neuroprotective; nootropic; antiparkinsonian; antilucer; osteopathic; neuroprotective; anticonvulsant; and antidepresant. The SESTs can be used for gene therapy and in vaccines. The SESTs are useful as probes for the identification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders antipodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (multiple sclerosis, insulin dependent diabetes), allergic conditions (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation disorders (haemophilia, thrombosis), inflammatory disorders (Crohn's disease), tumours, bacterial, fungal or viral infections, depression and

New isolated nucleic acid that is differentially expressed in cancer tissues useful for determining the presence of colon cancer in a cell or tissue type, and in antisense therapy -

Claim 1; Fig 1; 796pp; English.

expressed in cancer tissues. ABB78993 to ABB79004 represent proteins expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABG60776 to ABB67087 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and conceded by (I) is useful for detecting cancer in a patient sample, and nucleic acid which hybridises to (I) in a cell. A probe/primar derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the presence of collon cancer in a cell or tissue type, for determining the presence of colon cancer in a cell or tissue type, for determining the presence or macroarrays on a solid surface, to identify a cromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise the patient of the processor of analysis.

Sequence 572 BP; 208 A; 124 C; 111 G; 118 T; 11 other;
